A Generalization of the Cauchy–Davenport theorem

Mantas Bakšys University of Cambridge mb2412@cam.ac.uk

November 1, 2024

Abstract

The Cauchy–Davenport theorem is a fundamental result in additive combinatorics. It was originally independently discovered by Cauchy [2] and Davenport [3] and has been formalized in the AFP entry [1] as a corollary of Kneser's theorem. More recently, many generalizations of this theorem have been found. In this entry, we formalise a generalization due to DeVos [4], which proves the theorem in a non-abelian setting.
